

## To whom it may concern,

Our customer has expressed interest in acquiring one of our ableSlings. The ableSling has been designed specifically for children or adults that have neuromuscular or spinal cord injuries and others who are unable to independently self transfer from a to b.

The ableSling is a world's first, in-situ sling that has been designed to enhance day-to-day living. Its ability to be used with a hoist or for manual lifting, the discreet colour and nature compared to traditional slings give the individual a huge confidence boost. The ableSling also has a unique seating compartment, giving the ability to insert an existing wheelchair cushion or other type of cushion or support inside the ableSling. Therefore when in or out of the wheelchair, the individual can maintain pressure relief and support at all times.

The ableSling enhances day-to-day living in many ways, whether it's getting to and from the bed with a hoist, to simply being an in-situ sling for repositioning throughout the day, to it being a transfer solution when out in the community when hoists are not available and superb for emergencies.

The ableSling gives individuals flexibility, freedom and choice. Ensuring their safety, dignity and comfort is maintained at all times during day-to-day living. We believe our customer deserves the right to have access to this life-changing piece of equipment, forming part of their day-to-day living equipment.

Kind regards,

**Josh Wintersgill**
